

#### Background

Pediatric cardiac Intensive care (PCICU) patients are at a high risk for developing pressure injuries (PIs) related to decreased mobility and perfusion, poor nutrition, altered mental status and medical devices. Pain, infection, and prolonged hospitalization are also associated with development of PI's. Depending on the stage and severity, treatment can cost between \$2,000 and \$20,000.(1)

## Objective

Develop a unit based nurse led committee to promote evidence based practices on preventing pressure injuries (PI) in the pediatric cardiac intensive care (PCICU) population.

#### Methods

A kick off meeting was held to recruit members of the skin committee and Wound Ostomy Care RN.

Pressure injury unit data was presented to the staff.

Evidenced based practice literature reviewed by newly formed committee.

The following initiatives were created:

Monthly Meetings

High Risk Bedside Tool

o Committee Email

o Skin Survey

o Skin Fair

Skin Care Cart

Skin Audit Tool

Skin Care Corner

**Monthly Meetings.** Meetings are held among members of the skin committee and WOCN RN to disseminate information regarding Pl prevalence, initiatives, and product availability.

**Committee Email.** An email account has served as a mode of communication between the committee and staff to provide care updates/alerts and allow for questions and consultations.

9TSkinsavers@nyp.org

*Skin Fair.* An annual fair is held to inform all staff of current evidence based practice on PI prevention and provide education regarding documentation, skin impairments and treatments.

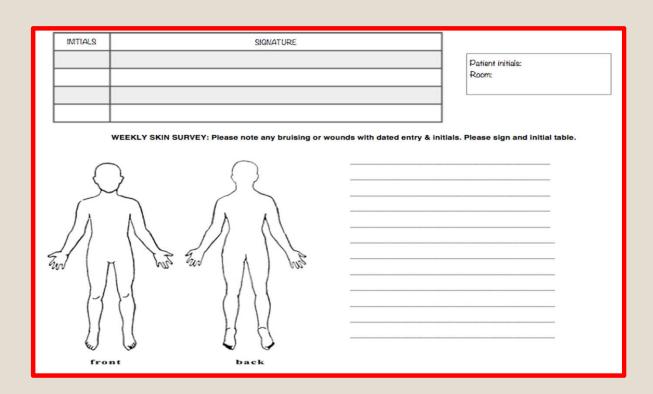

*Skin Audit Tool.* An audit is performed weekly to determine patients at high risk for skin breakdown. Factors leading to decreased mobility, altered perfusion/nutrition, and utilization of preventative strategies are assessed.

*Skin Survey.* Head to toe skin assessments are completed for patients identified as high risk. Preventative strategies and treatments are viewed with the patient/family and care team.

**Skin Care Cart.** The cart is kept on the unit and is stocked with skin protecting materials for high risks patients. It can be taken to the bedside.

#### **Skin Care Corner:**

- Displays the product of the month for all PCICU nurses to learn about.
- Updated monthly by an assigned committee member.

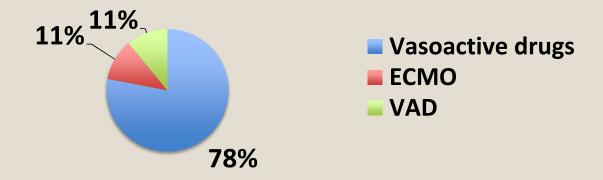

#### Results

During the months of January 2017-June 2017, 82 patients were surveyed by the PCICU skin team members.

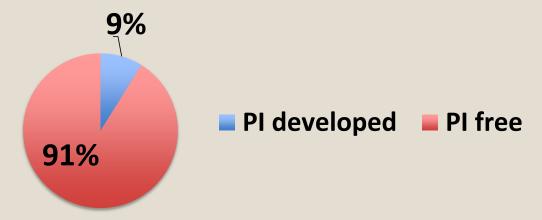

16% of the patients (20) surveyed met criteria for high risk.

The high risk identifiers included patients receiving therapy with vasoactive drugs (78%) and who were on Ventricular Assist Devices (11%) and Extra Corporeal Membrane Oxygenation (11%).

### Results

9% of the high risk patients (2) developed a pressure injury. 91% of the high risk patients (18) surveyed remained free of developing a PI.

#### Conclusion

Infants and children that are at risk for pressure injuries can be identified from documentation and skin surveys.

Interventions implemented early may prevent the development or progression of a pressure injury.

Collaborative efforts led by the PCICU skin care committee demonstrated improvement of pressure injury prevention and treatment.
